

Car Lift Made by NANI in Germany

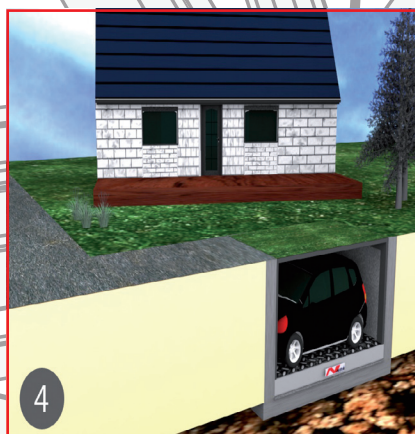

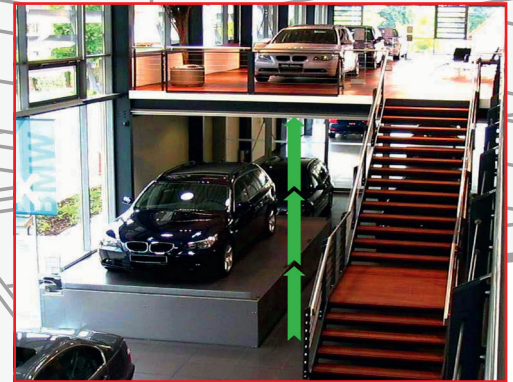

Car Lifts from Nani are lifting the cars between different levels of a building (e.g. parking garage) or serve as a concealed underground garage, as shown in the pictures 1 - 4 below.

In car showrooms such lifts are not only being used for the transport of the cars between the different levels of the showroom, but also as a show presentation lift.

The development, design and manufacturing of the car lifts take place in our own factory at one location.

Therefore we are able to fulfill any special request concerning the configuration, range of functions, design, coloring etc. of the lifts.

Additional features, such as PVC rollo barrier, "run-off-protection", Locks, reinforcement of the plateau, higher speeds, Bio-oil or the complete construction made of stainless steel are only some examples for all the additional requirements we could fulfill.

When using the car lift as underground garage the additional space you are achieving aboveground is the biggest advantage of course.

The canopy of the lift can be used as an additional parking space or can be designed as lawn. Otherwise one can use paving, tiles, asphalt, concrete or simply metal as floor covering.

This offers the possibility to create the car lift fitting to the local structural conditions in an aesthetic way.

Furthermore the car is protected against weather conditions and theft.
